Market Intelligence Brief for NovaTech Leadership

Summary for Leadership

NovaTech should consider a controlled Brazilian e-commerce pilot rather than an immediate broad launch. The Olist Kaggle dataset contains 99,441 orders and shows a 97.0% delivered-order rate, providing a useful historical fulfillment baseline. Historical item-price concentration is strongest in beauty/health, watches/gifts, home, sports/leisure, and computing accessories. The average basket is approximately 1.14 items per order, creating a testable cross-sell opportunity but not proving customer intent. Overall confidence is Medium because the internal evidence is specific but ends in 2018. Leadership should require current external market, competitor, logistics, and unit-economics validation before approving scale investment.

Key recommendations

1. Launch a small category pilot centered on beauty/health, watches/gifts, and home rather than a broad catalog.
2. Set operational gates for delivery completion, cancellation, returns, customer sentiment, and contribution margin.
3. Test bundles, complementary recommendations, and shipping thresholds to improve basket size.
4. Refresh current competitor, price, and consumer signals through Quick Research before funding expansion.

What should not be concluded

- The historical category totals do not prove current market share or future demand.
- A 97.0% delivered rate does not prove profitability, customer loyalty, or NovaTech's ability to reproduce the same performance.
- The 1.14-item basket does not prove that customers will respond to bundles without a controlled experiment.

Decision gate

Proceed to a time-boxed pilot only if current research confirms a differentiated value proposition and the pilot economics meet agreed contribution-margin and customer-experience thresholds.
